Introduction

VACOM offers a large variety of vacuum traps and oil mist separators. Different solutions come into consideration to fit different individual applications.

KF adsorption traps with heating prevent backstreaming of oil and vapour from the fore-vacuum pipes and mechanical booster pumps into the vacuum chamber. Usually they are filled with zeolite, which catches the gas particles due to its large surface and binds them. The zeolite can be regenerated many times, because of the integrated heater in the adsorption trap.

LN₂ cooling traps of stainless steel are integrated in high vacuum systems to achieve a systematic condensation of process gases or propellants on the cooled surfaces. Water, solvent and oil vapours as well as CO₂ condense at the cooled surfaces at a temperature of 77 K. The cooling traps are equipped with KF or ISO-K flanges for installation into the pump line of the vacuum system and for the outlet of the condensate.

The single- and multi-stage vacuum traps of the American manufacturer MASS-VAC are ideal for protecting pumps and vacuum pipes against contaminations and damages. Numerous variations and sizes are on offer. The traps are equipped with replaceable filter cartridges. Depending on the chosen filter type, diverse particles, condensable gases or other corrosive or reactive materials can be separated.

Oil mist separators bind oil vapour from mechanical boosting pumps and therefore prevent the contamination of the exhaust air. Depending on the pump size, there are different constructions possible. The replaceable filter elements withhold oil particles from a minimum size of 0.1 µm. This corresponds to a separation rate of 99.999 % of the emerging oil vapour.

Single-Stage Vacuum Traps

VISI-TRAP (Simple Adsorption Trap with Plastic Housing)

The adsorption trap VISI-TRAP consists of a transparent plastic housing with a particle filter to protect pumps against corrosion or vacuum against the back diffusion of oil from the pump.

Two filter sizes as well as a number of filter cartridges and connection nozzles are available for the individual demands of different applications. Filtering elements against water, oil or corrosive chemicals and fine particles are also available and are replaceable without opening the vacuum system.

Single-Stage Vacuum Traps

POSI-TRAP (Stainless Steel)

POSI-TRAP 4

POSI-TRAP 8

POSI-TRAP filter cartridges are in- and outlet sealed in order to completely filter the inflowing gas. POSI-TRAP housings are available with 180° opening flanges and as 90° versions.

Two POSI-TRAP sizes are available; the 4" type with one filter element and the KF flange DN25 as well as the 8" type with four filter elements and KF flanges DN40 or DN50. Both constructions are equipped with a snap closing, which enables a simple filter element exchange.

Technical data

- Construction stainless steel housing
- Seals Buna N O-rings

MULTI-TRAP (Multi-Stage High Performance Vacuum Trap)

The multi-stage high performance vacuum trap MULTI-TRAP protects oil sealed and dry running pumps used within reactive processes (e. g. TEOS, NITRIDE, LTO, HTO, PLASMA). It filters corrosive and during the driving process emitted particles, which would contaminate the vacuum pump, and therefore shortens the downtime or respectively lengthens the maintenance intervals. The three staged configuration offers an almost complete filtering of the flow:

Large and heavy particles as well as aerosols and liquids are filtered during the first stage at the large housing surface. Filter elements in the second and third stage filter reactive chemicals and fine particles. A large number of possible combinations enables a broad range of applications.

The MULTI-TRAP allows easy integration into an existing system. The housing cover can be removed for maintenance or cleaning purposes.

The arrows show the distribution of the process gases.

Constructions

- Five standardised models of different sizes are available
- Each of the MV-355040 and MV-355050 models have two stages with five parallel filter elements.
- Each of the MV-355080 and MV-3550100 models have two stages with six parallel filter elements.
- The model MV-355160 has two stages with eight parallel filter elements.

An additional cooling inductor is available for the models MV-355210 and MV-355212 for higher condensation in the first stage. The inductor is assembled at the bottom of the MULTI-TRAP and can be operated with various cooling systems (water, POLYCOLD). The gas flow has to go through this cooling stage before reaching the second stage with the filter elements.

Cold coil for:
MV-355210, MV-355212

Order code	Flange	Description
MV-355040	DN40KF	MULTI-TRAP 10" version; 1.5" in-/output; requires 5 filter elements in stage 2 and 5 elements in stage 3 (not included in the prize)
MV-355050	DN50KF	MULTI-TRAP 10" version; 2" in-/output (filter elements as MV-355040)
MV-355210	-	Option: cooling module for MV-355040 and MV-355050
MV-355080	DN80ISO-K	MULTI-TRAP 12" version; 3" in-/output; requires 6 filter elements in stage 2 and 6 elements in stage 3 (not included in the price)
MV-355100	DN100ISO-K	MULTI-TRAP 12" version; 4" in-/outlet (filter elements as MV-355040)
MV-355212	-	Option: cooling module for MV-355080 and 355100
MV-350160	DN160ISO-K	MULTI-TRAP 16" version; 6" in-/outlet; requires 8 filter elements in stage 2 and 8 elements in stage 3 (not included in the price)

Multi-Stage Vacuum Traps

Filter Elements (Cartridges for all Traps)

The filter elements are equipped with stainless steel end caps and Buna N seal rings for a long lifetime and durability. The large selection of filter elements and possible combinations enables a wide range of applications. Additionally it is also possible to deliver customised filter elements as required.

The filter elements are exchangeable and available in two sizes as well as of the following materials:

Order code 4.5" version	Order code 9.5" version	Material	Application
MV-300905	MV-300900	copper gauze	large surface absorbs condensate, particles and oil vapour
MV-300915	MV-300910	stainless steel gauze	such as copper gauze, only with corrosion protection
MV-300925	MV-300920	molecular sieve	reduces backstreaming of oil and vapour
MV-300935	MV-300930	Sodasorb®	filters corrosion particles, chemicals and neutralises acid vapours
MV-300945	MV-300940	activated charcoal filter	filters organic vapours
MV-400915	MV-400910	activated aluminium	filters acids, polar compounds, water and particles
MV-400925	MV-400920	PolyPro 2 µm	filters particles up to Ø 2 µm
MV-400935	MV-400930	PolyPro 5 µm	filters particles up to Ø 5 µm
MV-400945	MV-400940	PolyPro 20 µm	filters particles up to Ø 20 µm

Oil Mist Separator

OME (Oil Mist Eliminator with Transparent Housing)

Oil mist separators are assembled on the exhaust of rotary vane pumps to minimise the impact on the environment by filtering the oil mist emitted from the pump.

The OME oil mist eliminator is equipped with filter elements with a low gas resistance and filters oil mist of 0.1 µm at 99.999 %. Due to the transparent housing, it is possible to control the liquid stage of the separated oil.

Technical data

- Transparent polypropylene housing
- Buna N seal rings
- Replaceable filters of synthetic resin with imbedded glass fibres
- Separation percentage for oil mist: 99.999 %
- All-round mountable, bend and other adapters available
- Connections 3/4" NPT female thread
- Options adapter up to 1.0" (25 mm) for hose connection or DN25KF available
- Dimensions see figure
- Weight 1.1 kg

Order code	Description
MV-360500	OME oil mist eliminator with transparent housing, with one filter element
KF25NPT34	KF adapter, DN25
MV-301075	3/4" hose connection
MV-360905	replacement filter element

HCOME (High Capacity Oil Mist Eliminator)

HCOME 4

MV-360300

HCOME 8

MV-360200

The high performance oil mist separator HCOME is generally used for pumps with a pumping speed higher than 25 m³/h. Replaceable filters of synthetic resin with imbedded glass fibres enable a bonding of the oil mist at the pumps exhaust. Further fields of application are corrosive processes or applications using acetone as well as limited space requirements, where the oil mist filter has to be mounted directly on the pump exhaust. Furthermore the HCOME has an oil outlet unit for the oil feedback and can easily be disassembled and cleaned for maintenance purposes.

The HCOME 4 (HCOME 8) consists of one (three) filter element(s) and can be used for pumps with a direct fitting up to DN40KF (DN50KF). In general, the HCOME connection should not be smaller than 1.5 times the size of the pumps inlet port.

Technical Data

- Stainless steel housing
- Replaceable filters of synthetic resin with imbedded glass fibres
- Connections for 4" version KF flange, DN25 on pump side, 1" hose connection for exhaust
- Connections for 8" version KF flange, DN40 on pump side, 1 1/2" hose connection for exhaust

Dimensions	4" Version	8" Version
Diameter (mm)	102	203

MV-360915	MV-360915	replacement filter elements

Maxi-HCOME (High Capacity Oil Mist Eliminator)

The ultra high performance oil mist separator MAXI-HCOME consists of five parallel filter elements and can be used for pumps with a maximal pumping speed of 300 m³/h. There is also the possibility of oil feedback through an outlet unit.

Technical Data

■ Housing material	stainless steel
■ Connections	DN50KF on pump side, 1.5" NPT thread on exhaust side
■ Filters	five parallel, replaceable filters of synthetic resin with imbedded glass fibres (pore size 0.1 μ)
■ Diameter	254 mm
■ Total height	343 mm
■ Weight	6.8 kg

Order code	Description
MV-360000	incl. 5 filters and drain valve
KF50C	accessories: KF clamp rings, DN50
KF50SVCR	accessories: KF centring ring, stainless steel/FKM, DN50
EL50K	accessories: KF bend, 90°, DN50
